

Welcome to *your* website

Hi Yanelly! This is everything you need to take ownership of your site and start making it your own — **no tech experience required**. Just follow the steps in order. Each one is a few clicks, and Jon is one message away if you ever get stuck.

1 Create your free GitHub account

Go to **github.com** and click **Sign up**. GitHub is just the place your website's files live online — think of it as the filing cabinet for your site.

Then **send Jon your new username** so he can hand the website over to you.

Tip: write your username and password down somewhere safe — you'll use this account from now on.

2 Accept your website

Jon will transfer the website to your account. You'll get an **email (and a GitHub notification)** asking you to accept it — just click **Accept**.

That's it — the website is now officially yours. 🎉

3 Switch your website on

Open your project on GitHub, click **Settings**, then **Pages** on the left. Under "**Source**," choose **GitHub Actions**. Also make sure the project is set to **Public**.

Give it a minute or two — your site will be live at:

[https://\[your-username\].github.io/yanelly-fit/](https://[your-username].github.io/yanelly-fit/)

Important: your web address includes your username, so it'll be a little different from before. Once it's live, **update the link in your Instagram bio** to this new address.

4 Add Jon as your helper

So Jon can jump in whenever you need a hand: go to **Settings → Collaborators → Add people**, and type in his username:

brojonbeast

5

Connect your AI assistant (ChatGPT Codex)

This is the magic part — your AI that edits the website for you. In **ChatGPT**, open **Codex**, click **Connect to GitHub**, approve the pop-up, and choose your **yanelly-fit** project.

Heads up: Codex comes with the paid ChatGPT plans (Plus, Pro, or Business). Once it's connected, you're ready to build.

6

Make changes anytime — just ask

Tell Codex what you want in plain English, like:

"Add a recipe card for protein pancakes" or "Change my headline to ____."

Codex prepares the change and shows it to you as a **"pull request"** (a suggested update). When you like it, click **Merge** — and your live site updates in about a minute.

You can't break anything. Nothing changes on your real website until you click Merge — so feel free to experiment. You can also edit text right on GitHub using the little **pencil** icon.

Coming soon (with Jon's help)

Nothing to do yet — just so you know what's next:

 **Your email tool (Kit)** — to collect subscribers and automatically send your free Balanced Plate Cheat Sheet.

 **Your own domain** (like yanellyfuels.com) — set up through Cloudflare, under your account.

We'll set both up together when you're ready, all under your own accounts so everything stays yours.

A few words you'll see: **Repository / repo** = the folder holding your website. **Pull request** = a suggested change to review. **Merge** = approving that change so it goes live.

You've got this. 🍓

This is your website now — yours to grow however you want. Take it one step at a time, and message Jon anytime you hit a snag. He's still on the team.
